Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of the claims in the application.

In the Claims

- (Previously Presented) A collapsible structure including a door mechanism, comprising:
- a collapsible structure including an entranceway formed in a wall of the collapsible structure, the collapsible structure including a double-layered wall including a first layer of material and a second layer of material;
- a door configured to extend across the entranceway of the collapsible structure and being configured to move between an open position and a closed position, wherein the door is positioned between the first layer of material and the second layer of material of the double-layered wall;

wherein the door is adapted to permit simplified and unobstructed passage through the entranceway of the collapsible structure in the open position.

- (Previously Presented) The collapsible structure including a door mechanism of claim 1, wherein the door comprises a fan-shaped door configured to fit contiguously within the double-layered wall of the collapsible structure.
 - (Cancelled)
- (Previously Presented) The collapsible structure including a door mechanism of claim 1, wherein the door comprises a sliding door configured to fit within the double-layered wall of the collapsible structure.
- (Previously Presented) The collapsible structure including a door mechanism of claim 1, further comprising at least one reinforcement member coupled to the door.

- (Previously Presented) The collapsible structure including a door mechanism of claim 1, wherein the door further includes a fastener.
- (Previously Presented) The collapsible structure including a door mechanism of claim 1, wherein the door is constructed at least in part of a flexible material.
- (Previously Presented) A door mechanism for use in a collapsible structure, comprising:
- a fan-shaped door including a flexible sheet of material having a curved edge configured to extend across an entranceway of the collapsible structure and being configured to move between an open position and a closed position with curvilinear motion; and

at least one reinforcement member coupled to the fan-shaped door, the at least one reinforcement member extending across the flexible sheet of material from an attachment point toward the curved edge of the flexible sheet of material;

the fan-shaped door so characterized in that movement of the fan-shaped door between the open position and the closed position includes radial movement of the at least one reinforcement member pivoting about the attachment point.

- (Original) The door mechanism of claim 8, wherein the fan-shaped door is constructed at least in part of a flexible material.
- (Withdrawn) The door mechanism of claim 8, wherein the fan-shaped door is gravity supported in the open position.
- (Original) The door mechanism of claim 8, wherein the fan-shaped door is configured to automatically close.
- (Original) The door mechanism of claim 8, wherein said at least one reinforcement member comprises a plurality of reinforcement members.

- (Original) The door mechanism of claim 12, further comprising an attachment joint pivotally coupled to at least some of said plurality of reinforcement members.
- (Original) The door mechanism of claim 13, wherein the attachment joint comprises a pocket.
- (Withdrawn) The door mechanism of claim 13, wherein the attachment joint comprises at least one locking ring and mounting post.
- (Withdrawn) The door mechanism of claim 13, wherein the attachment joint comprises a grommet.
- 17. (Original) The door mechanism of claim 8, further comprising a fastener for securing the fan-shaped door to the collapsible structure in the closed position.
- 18. (Original) The door mechanism of claim 17, wherein the fastener comprises a pole insertable within a capture.
- (Withdrawn) The door mechanism of claim 17, wherein the fastener comprises a hook or clip member.
- 20. (Original) The door mechanism of claim 8, wherein the fan-shaped door is adapted to permit simplified and unobstructed passage through the entranceway of the collapsible structure in the open position.

21-38. (Cancelled)

- (Previously Presented) The door mechanism of claim 12, wherein the plurality of reinforcement members radiate outward from the attachment point at an angle to one another.
- (Previously Presented) A collapsible structure including a door mechanism, comprising:
- a collapsible structure including an entranceway formed in a wall of the collapsible structure; and
- a fan-shaped door including a flexible sheet of material configured to extend across the entranceway of the collapsible structure and being configured to move between an open position and a closed position with curvilinear motion, the fan-shaped door connected to the collapsible structure at an attachment point;

the fan-shaped door so characterized in that movement of the fan-shaped door between the open position and the closed position includes radial movement of the fanshaped door pivoting about the attachment point.

- 41. (Previously Presented) The collapsible structure including a door mechanism of claim 40, further comprising a first reinforcement member coupled to the fan-shaped door, the first reinforcement member extending across the flexible sheet of material from the attachment point.
- 42. (Previously Presented) The collapsible structure including a door mechanism of claim 41, further comprising a second reinforcement member coupled to the fan-shaped door, the second reinforcement member extending across the flexible sheet of material from the attachment point.
- 43. (Previously Presented) The collapsible structure including a door mechanism of claim 42, wherein the first reinforcement member and the second reinforcement member radiate outward from the attachment point at an angle to one another.

- 44. (Previously Presented) The collapsible structure including a door mechanism of claim 43, wherein the collapsible structure includes a double-layered wall including a first layer of material and a second layer of material, wherein the fan-shaped door is positioned between the first layer of material and the second layer of material of the double-layered wall.
- 45. (New) The collapsible structure of claim 1 wherein the double-layered wall is flexible.
- 46. (New) The collapsible structure of claim 1 wherein the first layer and the second layer are fabric.
- (New) The collapsible structure of claim 1 wherein the collapsible structure is a tent.
